iRODS User Group Meeting

# iCommands: An official command-line client

- Binary distributions for well known Linux distros
  - CentOS 7, Ubuntu 20, Debian 11 ...
- Data access functions for users
  - Create, Delete, Rename, List, Read, Write collections and data objects
  - high performance data access using parallel data transfer (iput, iget)
- System control for admins
  - Control users, groups, resources (iadmin, igroupadmin)

# Downside of iCommands

- Binary distributions are not available
  - For new Linux distros: Ubuntu 22.04
  - For other Linux distros: Arch Linux, OpenSUSE ...
  - For other OSes: Windows, MacOS
  - For other CPU Architectures: Raspberry Pi (ARM 64) ...
  - Not easy to build binaries from code by yourself
- Requires escalated privileges for installation
  - Not easy to obtain escalated privileges on institutional systems  
i.e., HPC, telescope control system

# GoCommands: A cross-platform command-line client

- A re-implementation of iCommands in Go language
  - Cross-platform support by Go
  - More functions for user-friendliness (e.g., bput)
- Binary distributions available for
  - Almost any systems (Linux, Windows, MacOS)
- No installation
  - Download a single binary file then run (no dependencies)
  - Perfect for running it as a guest user on institutional systems

# Supported environments

Binary Distribution	OS	CPU Architecture	Examples
Linux AMD64	Any Linux	Intel/AMD 64bit CPU	<ul style="list-style-type: none"> <li>Ubuntu 22.04 laptop</li> </ul>
Linux ARM64	Any Linux	ARM 64bit CPU	<ul style="list-style-type: none"> <li>AlmaLinux with Amazon EC2 ARM64 instance</li> <li>Raspberry Pi</li> <li>Nvidia Jetson</li> </ul>  
Windows i386	Windows	Intel/AMD 32bit CPU	<ul style="list-style-type: none"> <li>Windows 7 old laptop (before 2010)</li> </ul>
Windows AMD64	Windows	Intel/AMD 64bit CPU	<ul style="list-style-type: none"> <li>Windows 10 laptop</li> </ul> 
Darwin AMD64	MacOS	Intel/AMD 64bit CPU	<ul style="list-style-type: none"> <li>MacBook with Intel CPU</li> </ul>
Darwin ARM64	MacOS	ARM 64bit CPU	<ul style="list-style-type: none"> <li>MacBook with M1/M2 CPU</li> </ul>  

# Available commands

- Configuration

- ★ • “**init**”: Initialize iCommands configuration
- “**env**”: Display current environment

- User

- “**passwd**”: Change password
- ★ • “**copy-sftp-id**”: Copy SFTP public key

- System

- “**ps**”: Display iRODS processes
- “**svrinfo**”: Display iRODS server status

- GoCommands

- ★ • “**upgrade**”: Self upgrade to latest release

- Data Management

- “**cd**”, “**pwd**”, “**ls**”, “**mv**”, “**rmdir**”, “**rm**”, “**cp**”, “**cat**”
- “**bclean**”: Clear “**bput**” temporary files
- “**bun**”: Extract bundle files in iRODS
- ★ • “**get**”, “**put**”: Download/upload data in parallel
- ★ • “**bput**”: Upload data using bundling + parallel (for many small files)
- ★ • “**sync**”: Differential data transfer (using “**get**”, “**put**”, “**bput**”, “**copy**”)

- Ticket Management

- “**lsticket**”, “**mkticket**”, “**rmticket**”, “**modticket**”

# Configurations

- GoCommands configuration
  - JSON or YAML file
  - Environmental variables
- iCommands configuration File
  - ~/.irods/irods\_environment.json: configuration file
  - ~/.irods/.irodsA: encrypted password file

```
$ cat ./gocmd_config.yaml
irods_host: "data.cyverse.org"
irods_port: 1247
irods_user_name: "iychoi"
irods_zone_name: "iplant"
```

```
$ cat ~/.irods/irods_environment.json
{
  "irods_host": "data.cyverse.org",
  "irods_port": 1247,
  "irods_user_name": "iychoi",
  "irods_zone_name": "iplant"
}
```

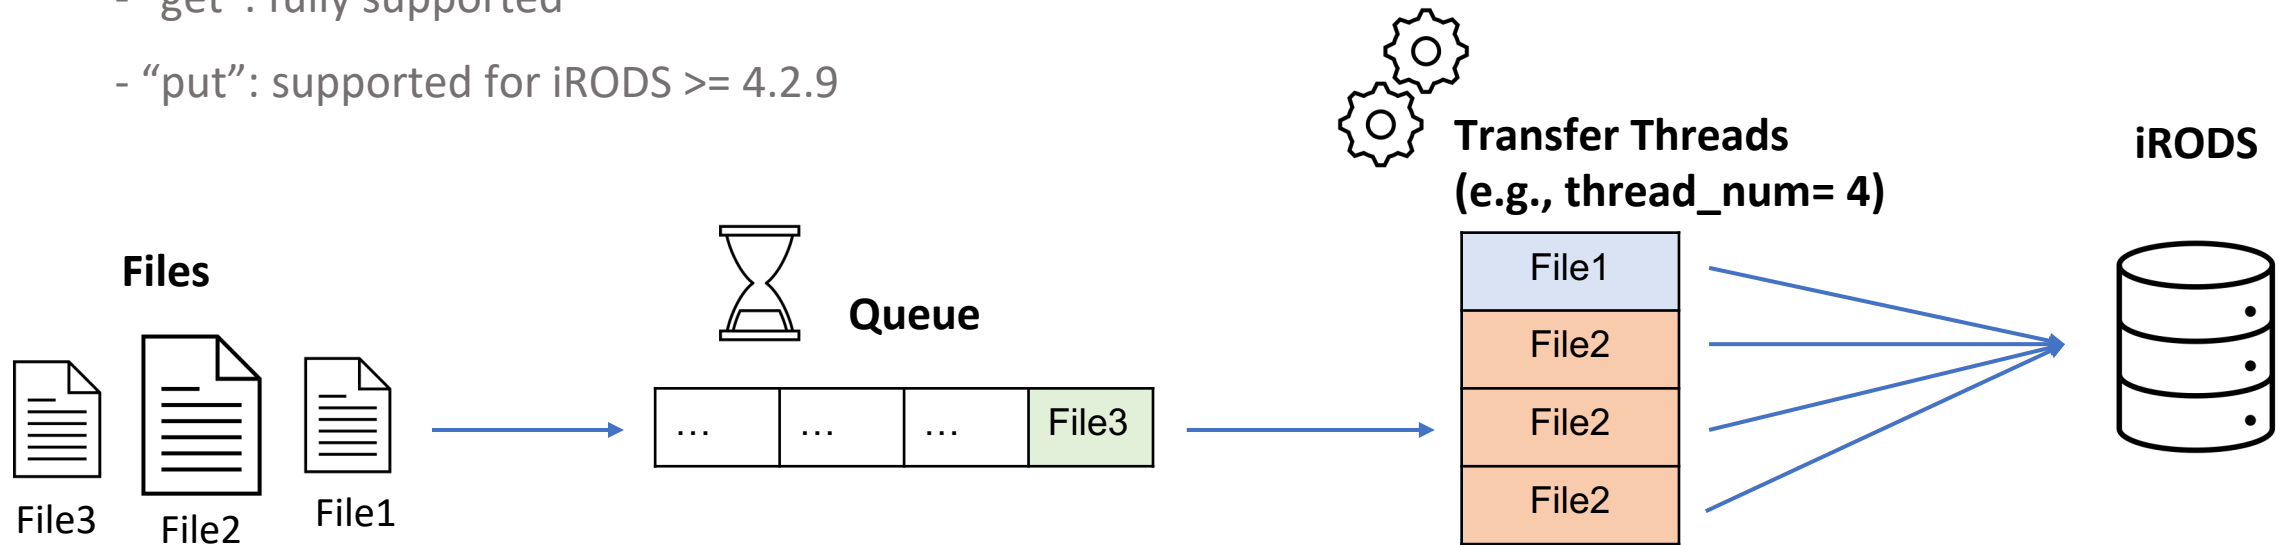

# Quick demo on Windows 10

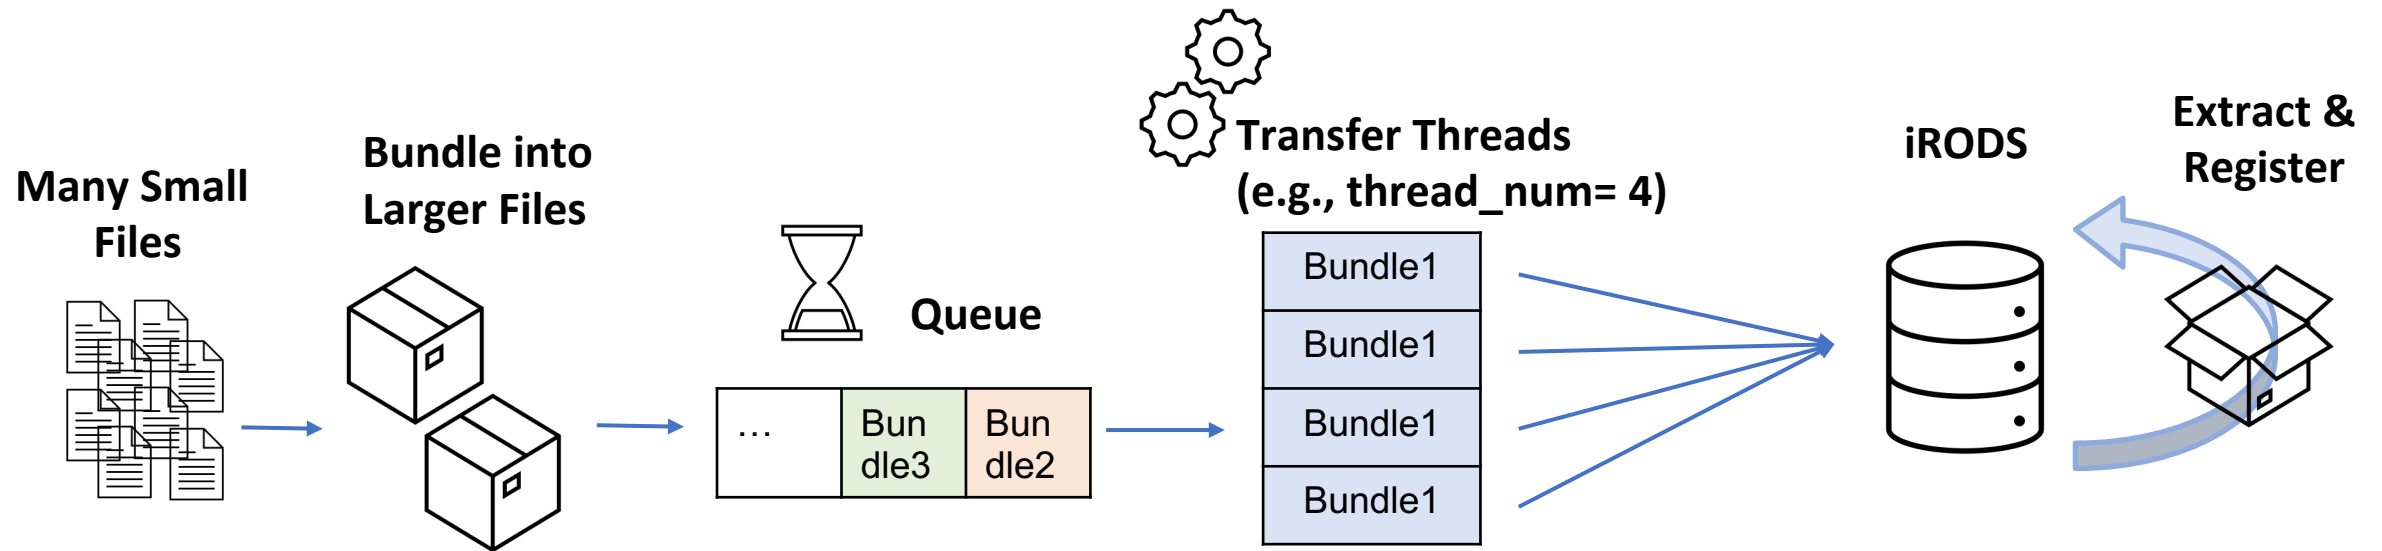

# Transfer optimizations

- Multi-threaded data transfer for “put” and “get”
  - Over port 1247
  - Parallel transfer of files
  - Parallel transfer of data blocks in a file
    - “get”: fully supported
    - “put”: supported for iRODS  $\geq 4.2.9$

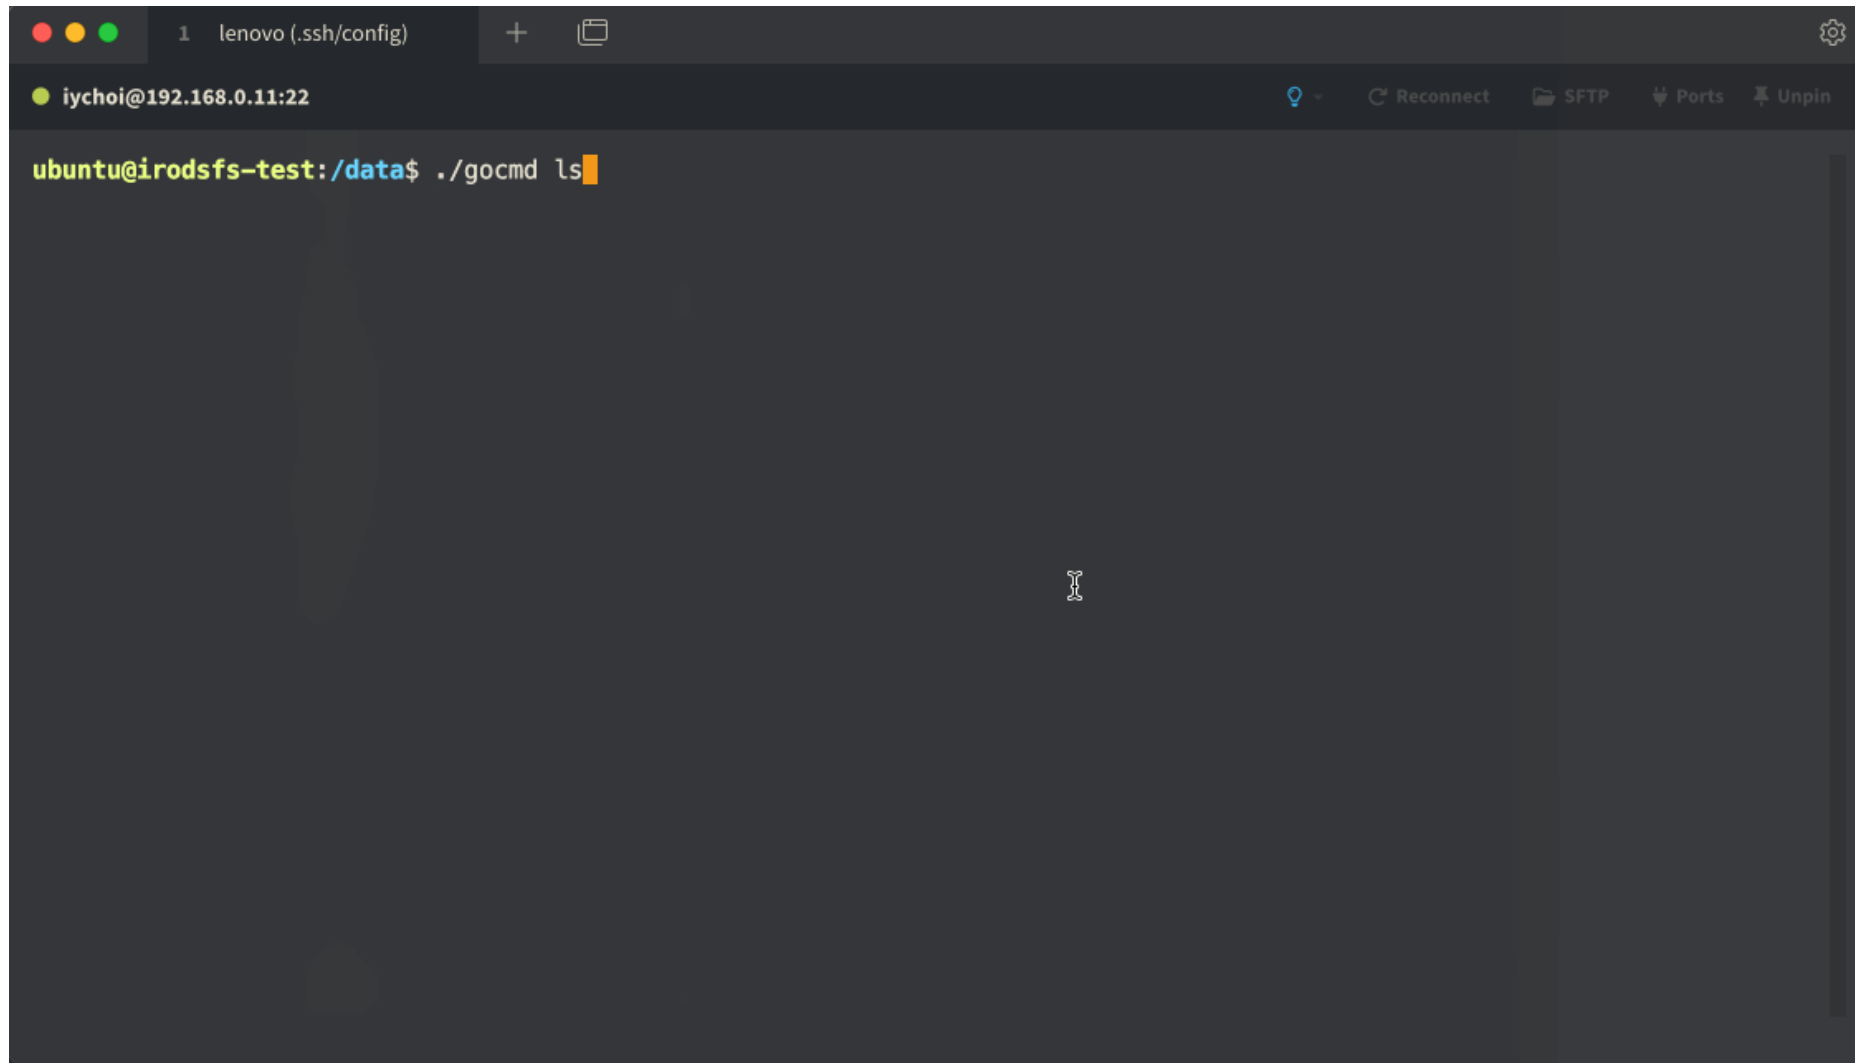

# Transfer optimizations

- Bundled parallel data transfer
  - Bundling many small files into GB-size tarballs and transfer in parallel for efficient bandwidth use
  - Extract bundle files in the iRODS server
  - Best for many small files (50+, <= 1GB files)
    - Used to transfer large telescope image data from Chile to CyVerse (US, Arizona)

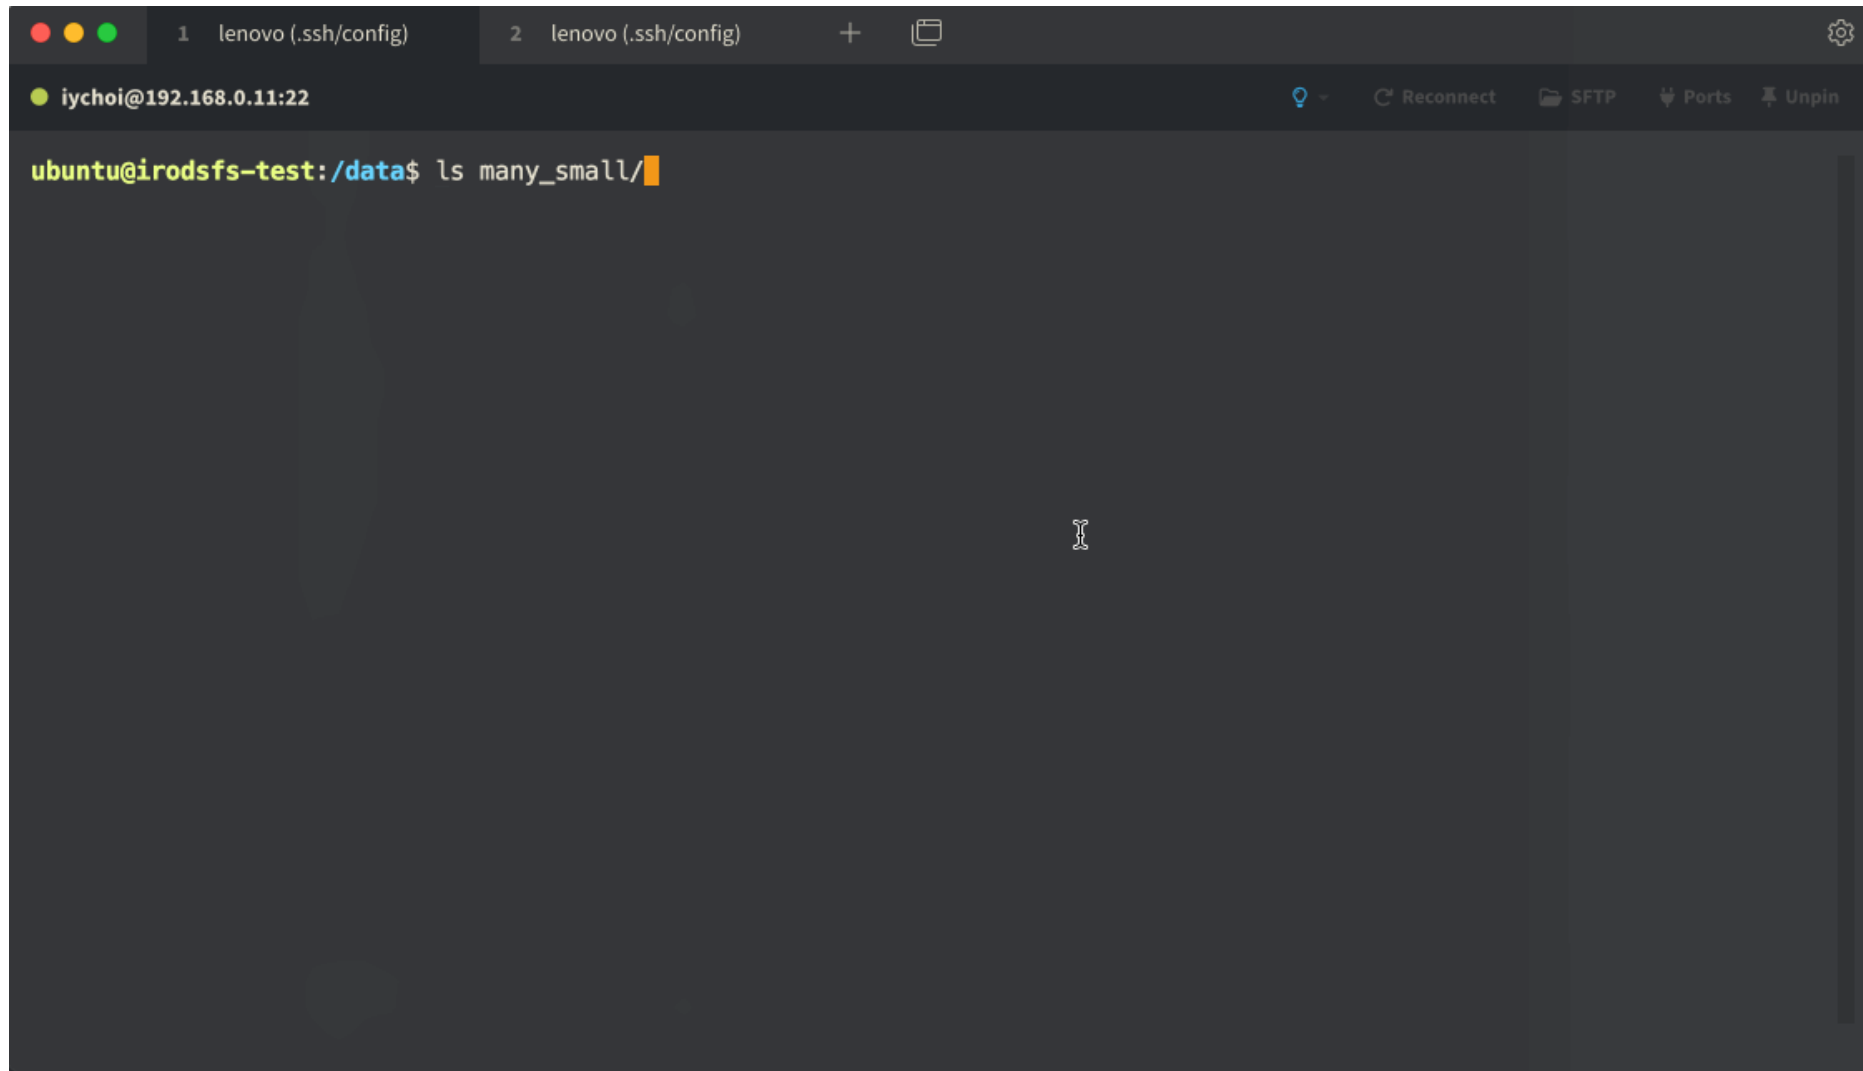

# Quick Demo - get

A terminal window with a dark background. The title bar shows "1 lenovo (.ssh/config)" and a settings icon. The terminal content shows a green prompt "iychoi@192.168.0.11:22" and a blue prompt "ubuntu@irodsfs-test:/data\$". The command ". /gocmd ls" is entered, followed by a cursor. The terminal also features icons for "Reconnect", "SFTP", "Ports", and "Unpin".

```
1 lenovo (.ssh/config)
iychoi@192.168.0.11:22
ubuntu@irodsfs-test:/data$ ./gocmd ls
```

# Quick Demo - bput

A terminal window with a dark background. The title bar shows two tabs labeled '1 lenovo (.ssh/config)' and '2 lenovo (.ssh/config)'. The terminal prompt is 'iychoi@192.168.0.11:22'. The command 'ls many\_small/' is entered, and the cursor is at the end of the line. The terminal interface includes a search icon, 'Reconnect', 'SFTP', 'Ports', and 'Unpin' options.

```
iychoi@192.168.0.11:22  
ubuntu@irodsfs-test:/data$ ls many_small/
```

# Failover

- Retry at failure
  - Data transfer commands, “put”, “get”, “bput”, and ”sync”, provide “--retry” flag
    - “--retry”: retry if fails with any error
    - “--retry\_interval”: retry after certain interval (e.g., 10m)
  - Differential data transfer: “--diff” and “--no\_hash”
    - “--diff”: compare the source and target files and transfer if only different
    - “--no\_hash”: compare files by file sizes, not by using MD5 hash

# Use-cases: Astronomic Data Transfer

- MagAO-X (Magellan Adaptive Optics Extreme)
  - Previously, had to travel with a lot of hard disks
  - Transfer image data between Las Campanas Observatory in Chile and CyVerse in AZ, US
    - High-latency network connection
    - larger TCP socket buffer & jumbo frames
  - A lot of short exposure images
    - many small files → "bput"
  - Roughly 20-25 MB/s

Magellan Clay telescopes at Las Campanas Observatory in Chile  
By Joseph Long, University of Arizona

# Use-cases: Aerial Image Transfer

- Open Forest Observatory
  - Transfer forest image data captured by drones
    - Many small files → “bput”
  - From the field laptop via cellular network
    - Low bandwidth, high latency network  
(Plan to switch to StarLink in the future)
    - Macbook laptop
  - Between CyVerse Data Store and compute clusters
    - CyVerse Discovery Environment and Jetstream2
    - No more `libssl` version issues on Ubuntu 22.04

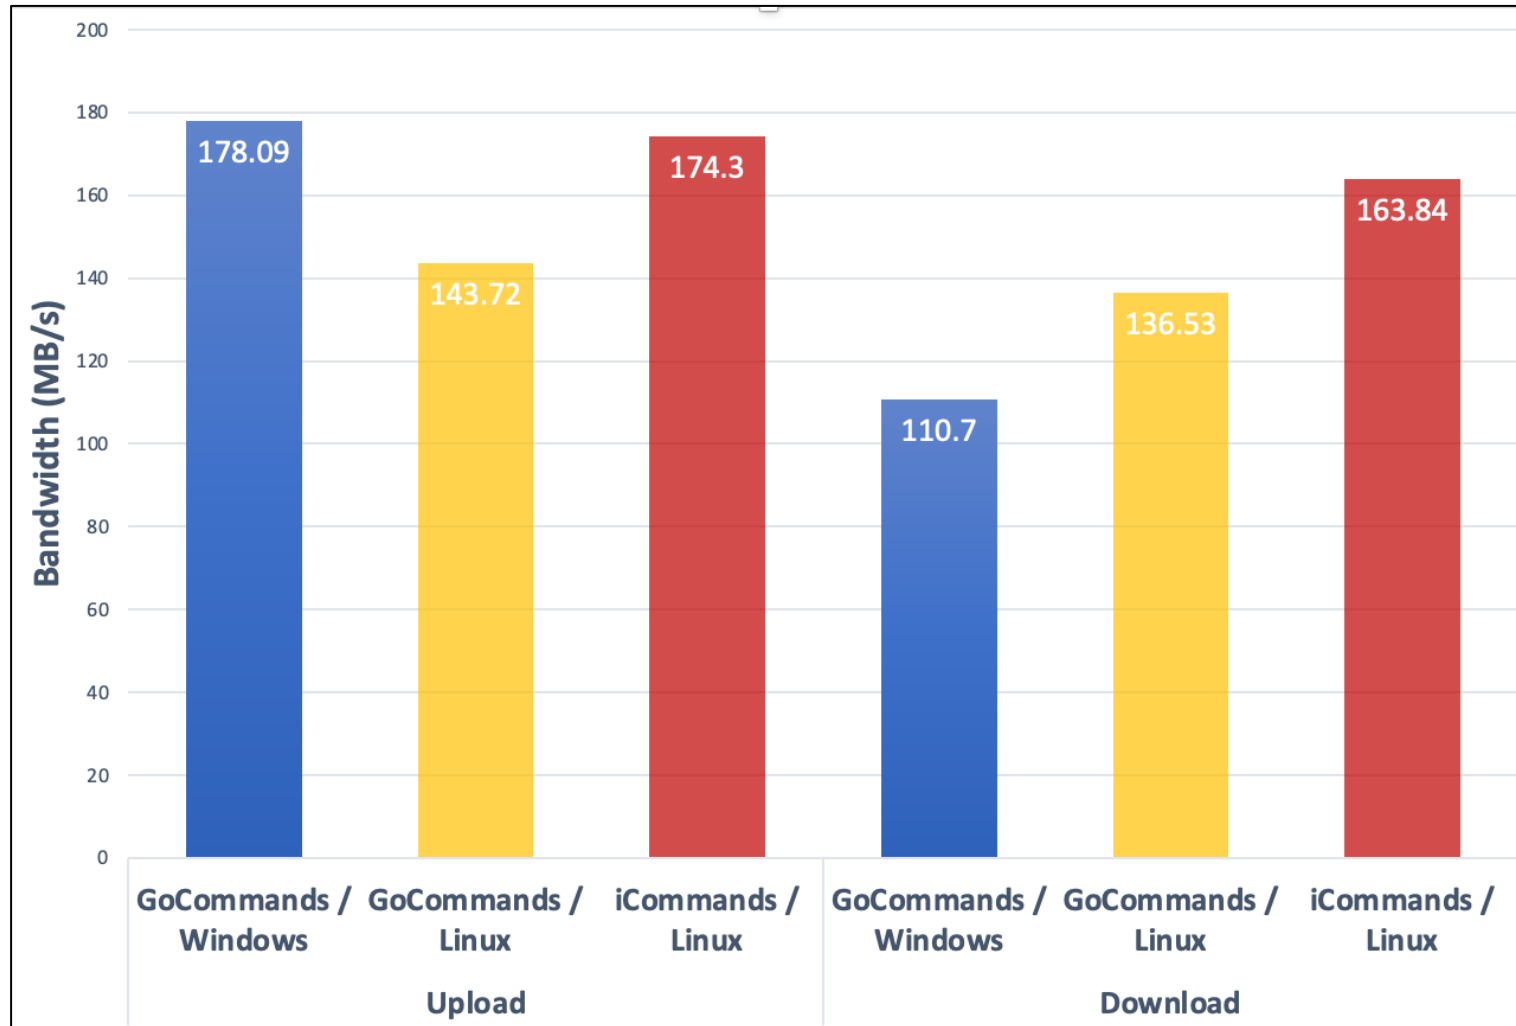

Resource Mapping with Drones

# Use-cases: Ad-hoc Data Transfer

- CyVerse Discovery Environment
  - Replaced iCommands with GoCommands
    - No admin commands needed for general users
    - No dependency issues (some apps run on recent Linux distros)

# Data Transfer Performance of GoCommands

GoCommands showed reduced performance than iCommands.

- No direct access to resource servers
- Yet unknown bottlenecks

# Future work

## Bugfixes

- Known issues  
(i.e., replication fail, metadata caching error, iCommands password decryption fail)
- New bugs reported by users

## New features

- Access control commands (i.e., change ACL, list groups)
- AVU control commands (i.e., list/add/remove AVU)

## Performance optimizations

- Implement direct data transfer from/to resource servers (like iget and iput)
- Investigate the current bandwidth bottleneck in Data Store

# Open-source

<https://github.com/cyverse/gocommands>

Use github issues to ask questions or report bugs

Pull-Request is always welcomed!

# Conclusion

## A cross-platform command-line client

- Works on almost any systems
- No installation required
- Provides user commands sufficient for data access

## Features

- Parallel file transfer & bundled parallel file transfer
- Retry at failure
- Differential data transfer

## Deployed in production

- Included in Featured Apps in CyVerse Discovery Environment
- Used by our collaborators

Questions?
