- iBridges CLI has been completely refactored
  - New commands added: `shell`, `rm`, now around ~ 80% coverage of API
  - Make the CLI more modular
  - New commands can now be added externally with plugins
- iBridges shell commands same as CLI commands
- Advantages shell versus CLI:
  - More responsive: session gets reused between commands
  - Shorter: commands are not prefaced with 'ibridges'
  - Autocompletion for local and remote paths (not for Windows)
